

UID LAB EXPERIMENT – 7

Basic Banking App – Low-Fidelity Wireframe Documentation (Pencil Sketch)

1. Introduction

This document outlines the initial design of a **basic banking mobile application**, created as a **lowfidelity wireframe using a pencil sketch approach**. The purpose of this design is to quickly visualize layout structure, screen flow, and core functionality without focusing on visual styling.

The sketch emphasizes **idea exploration and usability over aesthetics**.

2. Objective • To outline the **core features of a banking app •** To design a **simple and understandable user flow**

- To rapidly prototype ideas using **hand-drawn wireframes**
- To identify layout and usability issues early in the design process

3. Design Approach

The wireframe follows a **minimal and rough sketch style**, typically created using pencil tools.

Characteristics of the Design

- Rough outlines and placeholder boxes • Minimal text and basic labels
- No colors, typography, or visual styling
- Focus on **structure and placement only**

This approach allows quick modifications and encourages **early-stage feedback**.

4. Screen Overview

The wireframe consists of

four main screens, representing essential banking features:

1. Home (Dashboard)
2. Transfer Money
3. Cards
4. Profile

5. Screen-wise Description

5.1 Home Screen (Dashboard)

Purpose: Provide a quick overview of the user's account.

Key Elements:

- App title ("My Bank")
- Account balance display
- Quick action buttons (Send Money, View Statement)
- Recent transactions list
- Bottom navigation bar

Design Intent:

- Keep important information **visible at a glance**
- Provide shortcuts for frequently used actions

5.2 Transfer Screen

Purpose: Allow users to send money.

Key Elements:

- Input field for account number
- Input field for amount
- "Send" button

- Simple header with back navigation **Design Intent:**
- Keep the process **straightforward and distraction-free**
- Minimize input complexity

5.3 Cards Screen

Purpose: Display user's card information.

Key Elements:

- Debit card representation (masked number)
- Card balance
- Minimal layout with basic details **Design Intent:**
- Provide essential card info without clutter
- Maintain simplicity in presentation

5.4 Profile Screen

Purpose: Manage user account settings.

Key Elements:

- User avatar placeholder
- Name and email
- Options list:
 - o Personal Information
 - o Change Password
 - o Settings
 - o Logout

Design Intent:

- Organize account-related actions in one place
- Use a simple list format for clarity

6. Navigation Structure

- Bottom navigation enables switching between:
 - o Home
 - o Transfer
 - o Cards
 - o Profile
- Linear flow within screens (e.g., Home → Transfer)

7. Advantages of Pencil Wireframing

- **Fast and flexible:** Easy to draw and modify
- **Focus on usability:** No distraction from colors or UI styling
- **Encourages iteration:** Quick changes based on feedback
- **Low cost:** No tools or software dependency

8. Limitations

- Lacks visual clarity and polish

- Not suitable for final presentation
- Does not represent real UI behavior or interactions
- Requires further refinement into high-fidelity designs

9. Conclusion

The pencil-based wireframe successfully captures the **basic structure and functionality** of a banking application. It serves as a strong starting point for refining the design into a **detailed digitalUI** , ensuring that usability and flow are validated early in the process.
